

# The endTB-Q trial results

## What is the endTB-Q clinical trial?

*Each year, there are approximately 500,000 new cases of MDR-TB worldwide - but only a tiny fraction are successfully treated.*

The endTB-Q clinical trial, led by Médecins Sans Frontières/Doctors Without Borders, Partners In Health and Interactive Research and Development with co-funding from MSF, PIH and Unitaaid, is a randomized, controlled trial that aims to provide high-quality evidence on new, all-oral, shortened treatment regimens for people with a hard-to-treat form of MDR-TB, known as pre-extensively drug-resistant tuberculosis (pre-XDR-TB). The endTB-Q clinical trial enrolled 323 patients across six countries.

### Study treatment regimens

Trial Regimens	Bedaquiline	Clofazimine	Delamanid	Linezolid	Duration (months)
endTB-Q - BCDL	Bdq	Cfz	Dlm	Lzd	6 or 9
Control Arm	Standard of care (SOC) control, composed according to WHO Guidelines, may include Bdq and/or Dlm				18-24

## Main conclusions of the endTB-Q clinical trial

**BCDL for 6 or 9 months for people with pre-XDR-TB** produced high rates of **good outcomes** (87% cure), although slightly lower than the long regimen (89% cure).

**BCDL** started at 6 months—and extended to 9 months in case of delayed treatment response—achieved **excellent results in people with non-severe TB disease** at treatment start (93% cure).

In people with severe TB disease at treatment start, **BCDL for 9 months was not sufficient to prevent relapse** compared to the long regimen.

These findings came to light thanks to **key features of the trial design**: the **focus on** the previously neglected population with **pre-XDR-TB** and the choice to use an **internal control**, which was a modern, highly effective regimen.

**Strong treatment support** and **attentive management of side effects** remain critical to success.

## Interested in further learning from the endTB project data?

The endTB data sharing initiative (eDSI) aims to give ethical, equitable and transparent access to endTB data for a range of users who share the common goal of increasing knowledge and disseminating information to improve care for MDR-TB patients. endTB-Q data will be added in 2025.
